What is Brunata WebMon?

Brunata WebMon is short for "Web-based Monitor". It is an internet-based service developed by Brunata a/s. The purpose of Brunata WebMon is to display and print the information available in a BrunataNet system and it is only used in this connection. BrunataNet is a system for consumption measuring with remote reading. The system can collect/register/read remotely located meters of various kinds, including heating, energy, electricity and water meters.

Brief overview

We recommend that you quickly read through this brief manual to take full advantage of the Brunata WebMon system.

Tips

At abbreviations, hover the mouse over a word to see an explanation. Letters in bold are activated by pressing ALT+letter. Where the same letter appears several times, simply press ALT+letter twice.

Home page

The programme is designed with an easy-to-view left margin, which appears as soon as you log on. The top left-hand corner includes a scrolling field with the systems which you are authorised to view and generate reports on.

System information

Resident Administration

In Resident Administration, you as administrator are able to:

- Correct the resident's name and moving-in date.
Record removal of a resident (used if the current resident moves out and another moves in).
- Print an activation letter for the current resident, giving him or her access to Brunata WebMon Resident Access.

System level

Here you will find general information about the system, e.g. the types and number of meters and the terms of the system.

When you select a flat on the list, you are taken to the residents' area and see exactly the same as the resident (i.e. the same information presented in the same way). This makes it easier to deal with residents' problems over the telephone.

Flat level

Here you find an overview of all flats. When you select a flat number, specific information about this flat is displayed.

If a field in the schedule is underlined, you can change its content by clicking on the line and enter information in the field. You also have the following options:

See meter status

List of all flats and meters as well as the status of each meter when last read.

Reports

Brunata WebMon can generate reports at any level – from the current status of a particular meter to an overall report on the daily consumption status of all flats covered by the system:

Meter overview

List of all flats and meters in the system

Latest meter status

List of all flats and meters as well as the status of each meter when last read.

Consumption report

Enter start and end date and, if applicable, period to generate a list of all flats with their consumption for a given period ordered by meter usage.

This report also shows cooling for any energy meters.

System components

Components: List of all components set up in the system

Alarm

Meter alarm

Meters are added to the MeterAlarmList if no response has been received from a meter that has been set up or if no reading (telegram) has arrived from it within a user-defined period of e.g. a fortnight.

Min. Alarm

The Minimum Percentage Report allows you to generate a list of the meters with declining consumption on the basis of a self-selected percentage figure and number of days (which must always finish with today's date).

Max. Alarm

The Maximum Percentage Report allows you to generate a list of the meters with increasing consumption on the basis of a self-selected percentage figure and number of days (which must always finish with today's date).

Brunata is a 100% Danish owned company. We have more than 90 years of experience within developing and producing heat cost allocators, heating accounts and meter service. We have a quality system fulfilling DS/EN ISO 9001 and 14001. Please contact us if you would like more information about our products, want to contact one of our local branches or have any other questions.
